

Rosemount™ 3408 Level Transmitter

Non-Contacting Radar

- Smart features designed to make life easy
- Communicate via Bluetooth® wireless technology
- Advanced diagnostics and Smart Meter Verification
- NAMUR type tested and SIL 2 certified to IEC 61508 (SIL 3 capable)
- Versatile FMCW radar for application flexibility

Introduction

Flexible and fit for purpose

The Rosemount 3408 Level Transmitter provides accurate continuous level measurements in a broad range of process applications. The versatile design enables fit for purpose solutions and flexibility in use. For example, the transmitter can be used in tanks and vessels with small process fittings, corrosive environments, and open air installations. It is certified for use in hazardous locations and meets NAMUR recommendations.

Ease-of-use at every touch point

The Rosemount 3408 is designed to simplify operator tasks with pictorial instructions and an intuitive software interface. Bluetooth wireless technology allows for safe and convenient configuration and maintenance work.

Remote verification and proof-testing can be carried out from the control room at any time, without interrupting the process. Smart Meter Verification also enables operators to schedule automatic verification and receive formal reports. In addition, preventive diagnostic alerts let you know in advance when it is time to plan maintenance.

Increase plant safety

The Smart Diagnostics Suite provides operators with early alerts in case of antenna build-up or abnormal surface conditions. Also, a local memory enables full insight into the last three days of measurements, alerts, and echo profiles.

The Rosemount 3408 is safety certified (SIL 2/SIL 3), supports long proof-test intervals guaranteed to suit your schedule, and can be tested remotely without any process interruption.

Non-contacting radar technology

Non-contacting radar technology is ideal for a wide range of applications as it is maintenance-free, has a top-down installation that reduces the risk of leakages, and is unaffected by process conditions such as density, viscosity, temperature, pressure, and pH.

The Rosemount 3408 uses Frequency Modulated Continuous Wave (FMCW) technology and smart algorithms to maximize measurement accuracy and reliability, even in small tanks and challenging fast-filling vessels.

Application examples

Storage tanks

Ensure correct filling and storage levels in your tanks.

Mixing tanks

Gain insights into your process and ensure production runs smoothly without interruption.

Open air applications

Get reliable level measurements of sumps or ponds, regardless of challenging surface and weather conditions.

Safety applications

The Rosemount 3408 is suitable for safety applications such as overflow prevention, dry-run prevention, or level range monitoring.

Access information when you need it with asset tags

Newly shipped devices include a unique QR code asset tag that enables you to access serialized information directly from the device. With this capability, you can:

- Access device drawings, diagrams, technical documentation, and troubleshooting information in your MyEmerson account
- Improve mean time to repair and maintain efficiency
- Ensure confidence that you have located the correct device
- Eliminate the time-consuming process of locating and transcribing nameplates to view asset information

Ordering information

Online product configurator

Many products are configurable online using our Product Configurator. Select the **Configure** button or visit our [website](#) to start. With this tool's built-in logic and continuous validation, you can configure your products more quickly and accurately.

Specifications and options

See the Specifications and options section for more details on each configuration. Specification and selection of product materials, options, or components must be made by the purchaser of the equipment. See the Material selection section for more information.

Rosemount 3408 Level Transmitter ordering information

The Rosemount 3408 is a two-wire non-contacting radar transmitter for level measurements on liquids and slurries. It uses a unique energy efficient radar technology based on the FMCW principle to ensure reliable performance even in challenging conditions.

Performance specifications

General

Reference conditions

- Measurement target: Stationary metal plate, no disturbing objects
- Antenna: Process seal
- Temperature: 59 to 77 °F (15 to 25 °C)
- Ambient pressure: 14 to 15 psi (960 to 1060 mbar)
- Relative humidity: 25-75%
- Damping: Default value, 2 s

Instrument accuracy (under reference conditions)

- Ultra accuracy: ±0.04 in. (±1 mm)⁽¹⁾
- Standard: ±0.08 in. (±2 mm)⁽¹⁾

Repeatability

±0.02 in. (±0.5 mm)

Ambient temperature effect

±0.04 in. (±1 mm)/10 K

Sensor update rate

- Minimum 1 Hz (with 15 Vdc at 4 mA; 12 Vdc at 22.5 mA)
- Minimum 0.5 Hz (with 13 Vdc at 4 mA)

Maximum level rate

40 mm/s as default, adjustable up to 200 mm/s

Measuring range

Table 2: Maximum Measuring Range, ft. (m)

Antenna type	Basic Process Control System (BPCS)	Safety Instrumented Systems (SIS)
Process seal antenna	98 (30)	49 (15)
Lens antenna	49 (15)	49 (15)
ATAP lens antenna	98 (30)	49 (15)

(1) Refers to inaccuracy according to IEC 60770-1 when excluding installation dependent offset. See the IEC 60770-1 standard for a definition of radar specific performance parameters and if applicable corresponding test procedures.

Note that a combination of adverse process conditions, such as heavy turbulence, foam, and condensation, together with products with poor reflection may affect the measuring range.

Accuracy over measuring range

Figure 3 illustrates the accuracy over measuring range at reference conditions.

Figure 3: Accuracy Over Measuring Range

- A. Device Reference Point
- B. Accuracy in inches (millimeters)
- C. Distance in inches (millimeters)

Environment

Vibration resistance

2 g at 10-1000 Hz according to IEC 61298-3, level “field with general application”

Note

The bracket option does not meet the vibration requirements.

Electromagnetic compatibility (EMC)

- EMC Directive (2014/30/EU): EN 61326-1
- EN 61326-2-3
- NAMUR recommendations NE21

Pressure Equipment Directive (PED)

Complies with 2014/68/EU article 4.3

Built-in lightning protection

EN 61326, IEC 61000-4-5, level 2kV

Radio approvals

- Radio Equipment Directive (2014/53/EU):
 - ETSI EN 302 372 (TLPR)
 - ETSI EN 302 729 (LPR)
 - EN 301 489-17 and EN 300 328 (Bluetooth®)
 - EN 62479
- Part 15 of the FCC Rules
- Industry Canada RSS 211

Functional specifications

General

Field of application

Continuous level measurements on a broad range of liquids and slurries.

Measurement principle

Frequency Modulated Continuous Wave (FMCW)

Frequency range

77 to 81 GHz

Maximum output power

+5 dBm (3.2 mW)

Internal power consumption

< 0.8 W in normal operation

Humidity

0 - 100% relative humidity, non-condensing

Turn-on time

< 60 s⁽²⁾

(2) Time from when power is applied to the transmitter until performance is within specifications.

Functional safety

The Rosemount 3408 Level Transmitter is IEC 61508 certified to:

- Low and high demand: Type B element
- SIL 2 for random integrity @ HFT=0
- SIL 3 for random integrity @ HFT=1
- SIL 3 for systematic capability

4-20 mA HART®

Output

Two-wire, 4-20 mA. Digital process variable is superimposed on 4-20 mA signal, and available to any host that conforms to the HART protocol. The digital HART® signal can be used in multidrop mode.

HART universal revision

7

Load limitations

For HART® communication, a minimum loop resistance of 250 Ω is required. Maximum loop resistance (R) is determined by the voltage level of the external power supply (U_E):

U _E (Vdc)	R (Ω)
≥ 15.6	$R = 44.4 \times (U_E - 12)$
< 15.6	$R = 250 \times (U_E - 15)$

Figure 4: Load Limits

Analog signal on alarm

The transmitter automatically and continuously performs self-diagnostic routines. If a failure or a measurement error is detected, the analog signal will be driven offscale to alert the user. High or low failure mode is user-configurable.

Table 3: Signal on Alarm

Standard	High	Low
Rosemount standard	≥ 21.75 mA	≤ 3.75 mA
NAMUR NE43	≥ 21.0 mA	≤ 3.6 mA

Related information

[Alarm limits](#)

Analog saturation levels

The transmitter will continue to set a current that corresponds to the measurement until reaching the associated saturation limit (and then freeze).

Table 4: Saturation Levels

Standard	High	Low
Rosemount standard	20.8 mA	3.9 mA
NAMUR NE43	20.5 mA	3.8 mA

Related information

[Alarm limits](#)

Bluetooth® wireless technology

Minimum typical range

50 ft. (15 m) line of sight. Maximum communication range will vary depending on orientation, obstacles (person, metal, wall, etc.) or electromagnetic environment.

Diagnostics

Alerts

The transmitter is compliant with NAMUR NE 107 Field Diagnostics for standardized device diagnostic information.

Tools and logging in Rosemount Radar Master Plus

Rosemount Radar Master Plus enables easy and powerful troubleshooting with the echo curve tool as well as the measurement and alert log.

The measurement and alert log holds records of the last three days of level readings and echo curve profiles, as well as the 50 last alert events. The logs can be transferred from the transmitter’s internal memory to a local computer and be presented in a graphical time line, enabling analysis of historical behaviors.

Smart Diagnostics Suite

Signal Quality Metrics

Diagnostics package that monitors the relations between surface, noise, and threshold. The function can be used to detect abnormal conditions in the process such as antenna contamination or sudden loss of signal strength. Signal Quality is available as output variable and it comes with user configurable alerts.

Scaled variable

The scaled variable configuration allows the user to convert a device variable into an alternative measurement, such as flow, mass, or calibrated level (e.g. five-point point verification).

User defined variable

Allows designating more than 200 variables in the device as output variable.

Smart echo level test

The function allows you to test the behavior of the transmitter in a real tank environment without raising the level. During the test, a virtual surface echo is superimposed onto the radar signal, and the transmitter will output a level corresponding to the echo position.

The test verifies the integrity of the signal processing, and can be used to test the alarm limits in the host system, output of the transmitter, and transmitter configuration (for example the upper/lower range values).

Smart meter verification

Smart Meter Verification is an automatic diagnostic tool that monitors the entire transmitter’s performance and integrity without interrupting the process. The results of this diagnostic provide a pass/fail summary report helping you to quickly identify and resolve potential issues. Configuration changes since previous verification are tracked to verify consistency of the device setup.

The Smart Meter Verification functionality can be scheduled to run at defined intervals, or it can be initiated on demand.

Supported features

Table 5: Basic vs Professional

Feature	Basic	Professional
Manually initiated verification	✓	✓
Schedule verification	N/A	✓
Previous verifications stored	1	20
Printable report	N/A	✓

Process pressure

Final rating may be lower depending on flange selection.

Physical specifications

Material selection

Emerson provides a variety of Rosemount products with various product options and configurations, including materials of construction that can be expected to perform well in a wide range of applications. The Rosemount product information presented

is intended as a guide for the purchaser to make an appropriate selection for the application. It is the purchaser's sole responsibility to make a careful analysis of all process parameters (such as all chemical components, temperature, pressure, flow rate, abrasives, contaminants, etc.), when specifying product, materials, options, and components for the particular application. Emerson is not in a position to evaluate or guarantee the compatibility of the process fluid or other process parameters with the product, options, configuration, or materials of construction selected.

Engineered solutions

When standard model codes are not sufficient to fulfill requirements, please consult the factory to explore possible Engineered Solutions. This is typically, but not exclusively, related to the choice of wetted materials or the design of a process connection. These Engineered Solutions are part of the expanded offerings and may be subject to additional delivery lead time. For ordering, factory will supply a special P-labeled numeric option code that should be added at the end of the standard model string.

Housing and enclosure

Electrical connections

Two cable/conduit entries ($\frac{1}{2}$ -14 NPT or M20 x 1.5)

Housing material

Polyurethane-covered aluminum

Ingress protection

Process seal and lens antennas

- IP 66/67/68⁽³⁾
- NEMA[®] 4X

ATAP lens antenna

- IP 65
- NEMA[®] 4X

Antenna versions

Process seal antenna

All PTFE wetted parts ideal for use in corrosive applications

Lens antenna

Suitable for use on vessels with small process fittings

ATAP lens antenna

Designed for open air installations and non-pressurized tanks

(3) The transmitter meets IP 68 at 3.3 ft. (1 m) for 45 minutes.

Material exposed to tank atmosphere

Process seal antenna

- PTFE sealing: PTFE fluoropolymer

Lens antenna

- PTFE sealing: PTFE fluoropolymer
- Threaded process connection: Stainless steel 316/316L (EN 1.4404)

ATAP lens antenna

- PTFE sealing: PTFE fluoropolymer
- Threaded process connection: Anodized aluminum 6082-T6 or 6061-T6
- O-ring: FKM
- Antenna extension for open air: PTFE fluoropolymer with carbon filler

Electrical connection

Power supply

The transmitter operates on max. 35 Vdc transmitter terminal voltage and max. 22.5 mA (max. 30 Vdc in Intrinsically Safe installations).

Cable selection

Use 24-16 AWG wire (0.20-1.5 mm²). Twisted pairs and shielded wiring are recommended for environments with high EMI (electromagnetic interference).

Fine stranded conductors shall be equipped with a ferrule.

Installation considerations

Before installing the transmitter, follow recommendations for mounting position, sufficient free space, nozzle requirements, etc.

Mounting position

When finding an appropriate location on the tank for the transmitter, the conditions of the tank must be carefully considered.

Consider the following guidelines when mounting the transmitter:

- For optimal performance, the transmitter should be installed in locations with a clear and unobstructed view of the product surface.
- The transmitter should be mounted with as few internal structures as possible within the signal beam.
- Do not install the transmitter in the center of the tank.
- Do not mount close to or above the inlet stream.
- Do not mount the transmitter on a manway cover.
- Do not position the transmitter directly over a side manway door.
- Multiple Rosemount 3408 transmitters can be used in the same tank without interfering with each other.

Figure 7: Recommended Mounting Position

Free space requirements

If the transmitter is mounted close to a wall or other tank obstruction such as heating coils and ladders, noise might appear in the measurement signal. See [Table 7](#) for recommended clearance.

Figure 8: Free Space Requirements

Table 7: Distance to Tank Wall (L)

Minimum	Recommended
8 in. (200 mm)	½ of tank radius

Inclination

The transmitter should be mounted vertically to ensure a good echo from the product surface. See [Figure 9](#) for recommended maximum inclination.

Figure 9: Inclination

Non-metallic tanks

Nearby objects outside the tank may cause disturbing radar echoes. Wherever possible, the transmitter should be positioned so that objects close to the tank are kept outside the signal beam.

Beam angle and beam width

The transmitter should be mounted with as few internal structures as possible within the signal beam.

Figure 10: Beam Angle and Beam Width

Table 8: Beam Angle

Antenna type	Beam angle (α)
Process seal antenna	8°
Lens antenna (¾-in. thread)	12°
Lens antenna (1- and 1½-in. threads)	9°
ATAP lens antenna	8°

Beam width

See [Table 9](#) for beam width at different distances.

Table 9: Beam Width (W), ft. (m)

Distance (D)	Beam angle (α)		
	8°	9°	12°
16 (5)	2.2 (0.7)	2.5 (0.8)	3.4 (1.1)
33 (10)	4.6 (1.4)	5.2 (1.6)	7.0 (2.1)
49 (15)	6.9 (2.1)	7.8 (2.4)	10.4 (3.2)
66 (20)	9.3 (2.8)	10.5 (3.2)	14.0 (4.3)
82 (25)	11.5 (3.5)	13.0 (4.0)	17.4 (5.3)
98 (30)	13.8 (4.2)	15.5 (4.8)	20.8 (6.4)

Nozzle requirements

To allow the microwaves to propagate undisturbed, the nozzle dimensions should be kept within the specified limits as given in [Table 10](#). The inside of the nozzle must be smooth (i.e. avoid bad welding, rust, or deposit).

Figure 11: Mounting in Nozzles

Table 10: Nozzle Requirements

Nozzle diameter (D)	Maximum nozzle height (H)
1 in. (25 mm) ⁽¹⁾	3.9 in. (100 mm)
1.5 in. (40 mm)	5.9 in. (150 mm)
2 in. (50 mm)	7.9 in. (200 mm)
3 in. (80 mm)	11.8 in. (300 mm)
4 in. (100 mm)	15.8 in. (400 mm)
6 in. (150 mm)	23.6 in. (600 mm)

(1) Not applicable to the process seal antenna.

Product certifications

See the Rosemount 3408 [Product Certifications](#) document for detailed information on the existing approvals and certifications.

Dimensional drawings

Figure 12: Process Seal Antenna

- A. LCD display option
- B. No LCD display

Dimensions are in inches (millimeters).
